

## MK5 EXTENDED AXLE WHEELS AND CRANKS FOR OUTSIDE FRAME LOCOMOTIVES

The Mk5 Locomotive Wheels feature a different design of extended axle compared with earlier versions of the wheels. The Mk5 variants incorporate an extended axle with a smaller diameter (0.75mm) than the main stub axle (1.5mm). These two elements are part of the same turning for improved concentricity.

To complement these wheels, a range of machined cranks is made available. The initial range includes a Class 08 pattern and a generic pattern. A blank disc is also available, from which members might fabricate their own locomotive specific set of cranks.

The cranks are a close fit over the axle and need only be fixed with your choice of adhesive. Crank pins can similarly be glued or soldered to each crank. Once in place, quarter your wheels in the usual manner.
